Bonaido, Ph.D. CDNA Library Arrayed by: The I.M.A.G.E. Consortium (LLNL)
DNA Sequencing by: Washington University Genome Sequencing Center
Clone distribution: NCI-CGAP clone distribution information can be
found through the I.M.A.G.E. Consortium/LLNL at:
image.llnl.gov/image/html/iresources.shtml
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT773 vector. Library went through one round of normalization, and was constructed by Bento Soares and M. Fatima Bonaldo. "

comprise a human-derived promoter or mammalian homologue and a sequence acceptance site that is designed to directionally accept sequence specific products from RT-PCR based cloning strategies via a unique site within an interrupted palindrome recognition sequence for a restriction endonuclease which is incorporated into the PCR primer. In this embodiment, the palindrome recognition sequence is for Bgll. The 5' acceptance site reads on the positive strain, and includes a GC sequence recognised by Bgll and an ATG start codon. The 3' GCC moiety keeps the sequence in-frame and vectors are used to express target antigens, especially tumour antigens. They are non-replicating in mammalian cells but are companied.
                                                                                                                                                                                                                                                                                                                                                                        generate immune responses to the target sequences with little or no
  polynucleotide vectors such as pITL (see AAV21724).

Novel human cytoplasmic Notch signaling protein and polynucleotide useful for identifying compounds that modulate Notch signaling protein and for diagnosis, treatment of leukemia, T lymphoblastic lymphoma -

Example 2; Page 16; 60pp; English.

The present DNA sequence is the PCR primer, 5'ORF1 used to amplify the coding region from the start site of ORF1 through the common stop codon (479-2347), using human spleen cDNA library as the template. The 5'end PCR primer incorporates a Kozak consensus sequence prior to the ATG codon. The human cytoplasmic Notch signalling protein, Deltex (AZDX), is integral to cell differentiation and proliferation. It binds to the ankyrin repeat region of human Notch receptor and functions as a

```
The present DNA sequence is the PCR primer, 5'ORF2 used to amplify the coding region from the start site of ORF2 through the common stop codon (485-2347), using human spleen cDNA library as the template. The 5'end PCR primer incorporates a Kozak consensus sequence prior to the ATG codon. The human cytoplasmic Notch signalling protein, Deltex (hzDX), is integral to cell differentiation and proliferation. It binds to the anythin repeat region of human Notch receptor and functions as a regulator of Notch signalling pathway and has cytostatic activity. hzDX sequence is useful to identify compounds that modulate biological or pharmacological activity of Deltex Notch signalling protein. Specific antisense oligomers and dominant negative mutants are useful for therapeutic purposes. It is also used for diagnosis and treatment of conditions associated with aberrant Notch signalling, like cancers.
                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        proliferation; ankyrin repeat; regulator; cytostatic; modulator; cancer; diagnosis; treatment; T lymphoblastic lymphoma; leukemia; lung carcinoma; adenocarcinoma; cervical neoplasia; PCR primer; ss.
regulator of Notch signalling pathway and has cytostatic activity. hzp. sequence is useful to identify compounds that modulate biological or pharmacological activity of Deltex Notch signalling protein. Specific antisense oligomers and dominant negative mutants are useful for therapeutic purposes. It is also used for diagnosis and treatment of conditions associated with aberrant Notch signalling, like cancers, including T lymphoblastic lymphoma, leukemia, adenocarcinoma, lung carcinoma and cervical neoplasia. The nucleotide sequence is useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence for deletion mutant PCR primer #1 is used with PCR primer #2 (AASO1418) to obtain mouse alpha2delta subunit deletion mutant from the wild type mouse calcium channel alpha2delta-3 subunit (AAMU01026). The sequence is described in an invention relating to truncated alpha2delta-2, alpha2delta-3 or alpha2delta-4 subunit soluble proteins which retain their affinity for radioactively labelled gabapentin. The alpha2delta subunit is 1 of the components of the heteromultimeric voltage-dependent calcium channel (VDCC) complexes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      skeletal muscle. Numerous soluble forms of the human calcium channel alpha2delta subunits (AAU01014-AAU01024 and AAU01032-AAU01038) and 5 soluble forms of the porcine calcium channel alpha2delta subunits (AAU01027-AAU01031) are described. The secreted soluble alpha2delta subunit may be used in assays e.g. scintillation proximity assay (SPA), flashplate, nickel flashplate, filter binding or wheat germ lectin flashplate assays to detect or measure the binding or interaction of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Calcium channel alpha2delta subunits, useful in e.g. SPA assays, Flashplate assays, Nickel Flashplate assays, Filter binding assays or Wheat Germ Lectin Flashplate assays -
                                                                                                                                                Gaps
carcinoma and cervical neoplasia. The nucleotide sequence is useful for diagnostic assays to detect expression levels of h2DX.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a new method for screening ligands which bind a cerebral cortical voltage-dependent calcium channel alpha2delta subunit, preferably alpha2delta-1 subunit. The method comprises contacting a secreted soluble recombinant alpha2delta-1 subunit with a ligand of interest and a labelled compound which binds the subunit, followed by measuring the level of binding of the labelled compound to alpha2delta-1 subunit. The method is useful for screening ligands, preferably biologically active products that modulate a nervous system function, which bind a cerebral cortical voltage-dependent calcium channel and plazdelta-1 subunit. The ligands identified by the method are useful
ligand (e.g. gabapentin, L-Norleucine, L-Allo-Isoleucine, L-methionine, L-Leucine, L-Isoleucine, L-Valine, Spermine and/or L-Phenylalanine) of a calcium channel alpha2delta subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            treating disorders of the nervous system, including pain, epilepsy anxiety. BSK-PEMI was made from BS-PEMI by the replacement of the 21 bp
XMOI/HindIII fragment with a 24 bp (sio) fragment encoding a
consensus eukaryotic ribosome binding site. The purpose of the
construct was to increase the yields of in vitro translated PEMI
                                                                                                                                                                                                                                                                                                                                                                                            Bacterial toxin-antigen protein conjugates - to elicit of T-lymphocyte immune response, used for preventing viral infections, e.g. by influenza virus, HIV and human papilloma:virus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The construct BS-PEMI encodes a hybrid protein comprising domains I and II from Pseudomonas exotoxin fused to amino acids 2-252 of the influenza A virus matrix protein MI. The PE-derived portion of the hybrid protein allows internalisation of the protein by an antigen. Presenting cell. The hybrid protein is then processed and an antigence segment (i.e. the Influenza A virus matrix protein) is presented on the cell surface where it elicits an immune response. BSR-PEMI was made from BS-PEMI by replacing the 21bp XhoI/HindIII fragment with a fragment (i.e. AAQ41717) encoding a consensus eukaryotic ribosome binding site. The purpose of the construct was to increase the yields of in vitro translated PEMI protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                             δ
                                                                                                                                                                  The sequences given in AAQ52485-86 are primers which were used in the construction of the rBPI-IgG fusion vector, pING4533. This plasmid contains recombinant bactericidal/permeability-increasing protein contains recombinant bactericidal/permeability-increasing protein contents Sozak sequence given in AAO52487. The rBPI fragment was fused to consensus Kozak sequence given in AAO52487. The rBPI fragment was fused to a constant domain of an IgG heavy chain (HC). Plasmids such as produce fusion proteins which are useful for the treatment of Gram negative bacterial infections and their sequelae including endotoxin related shock and conditions associated with it, such as disseminated intravascular coagulation, anemia, thrombocytopenia, leukopenia, adult respiratory distress syndrome, renal failure, hypotension, fever and metabolic acidosis. Proving BPI or a fragment of it, as part of the fusion with an immuno-globulin heavy chain constant region provides the potential advantages of Fc receptor binding, bivalent binding to lipopolysaccharide
                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Efficacy of such compsns. is improved when they comprise at least 50% of the truncated rBPI in dimeric form. The present sequence is that of a PCR primer used in the construction of a vector coding for rBPI(1-199) in which native Cys at position 132 is replaced by Ala and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     bactericidal-permeability increasing protein; BPI; truncated; dimer;
endotoxic shock; heparin neutralisation; anglogenesis; inhibitor; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                      truncated derivative of human mature BPI carrying a C132A mutation, rBPI(1-199) 926115., in which the codon specifying the 5th amino acid of the BPI signal peptide is placed in the context of the consensus Kozak translation initiation sequence (AAQ67275) and the first 4 amino acids of the BPI signal are removed. This is accomplished by PCR amplification of BPI CDNA using primers BPI-23 (AAQ67276) and BPI-2 (AAQ67277).
                                                                           Bactericidal-permeability-increasing protein analogues with $$15.12 or Cysl35 replaced - also fusion proteins and C-terminally truncated forms, have increased stability and are useful to treat gram-negative bacterial infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     rBPI(1-199)-Ala132 (with 27 amino acid signal) PCR primer BPI-23.

```
Recombinant endotoxin-binding protein comprising bactericidal/permeability increasing protein (BPIP) or its endotoxin N-terminal fragment, can be produced by growing genetically transformed host rells in a suitable medium so that BPIP is secreted into the medium. The BPIP is then isolated and can be used to control bacterial infections. The same method can be used where BPIP is replaced with structurally related protein. Inmulus anti-LPS factor, tachyplesin or structurally related protein. This sequence is reproduced in the
                                                                                                                                                                                                                                                                                                                                                                                                                       Probe/Primer for bactericidal/permeability increasing protein gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Recovery of recombinant endotoxin binding protein - by culturing transformed cells in medium contg. cation exchange material, useful for treatment of bacterial infections.
first 4 amino acids of the BPI signal peptide are removed; the codon specifying the fifth amino acid of the signal sequence (Met at position -27) is placed in the context of a consensus Kozak translation initiation sequence. The truncated rBPI is suitable for dimerisation in the presence of copper 2+ ions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           permeability increasing protein; BPIP; infection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is primer for the PCR amplification of bactericidal permeability increasing (BPI) protein DNA from the plasmid pindsf33. The DNA was used in the preparation of a hybrid fusion protein, comprising an amino-terminal BPI protein and a carboxy-terminal immunoglobulin heavy chain constant region. The fusion protein can be used to treat Gram-negative bacterial infections and their sequelae, e.g. endotoxic shock, and associated conditions, e.g. disseminated intravascular coaquilation, anaemia, thrombotytopenia, leukopaenia, adult respiratory distress syndrome (ARDS), renal failure, hypotension, fever or metabolic acidosis. The fusion protein provides the potential advantages of Fc receptor binding, bivalent lipopolysaccharide binding, complement binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                  RT-PCR primer 1 and RT-PCR primer 2 (see AAV21729) were used to amplify a portion of p53 cDNA (see AAV21730). The primers include mutated sequences that allow the amplified product to be incorporated into vectors such as plasmid pITL (see AAV21724). Novel humanised vectors, which can be based on piTL, comprise a human derived promoter (or mammalian homologue) which is functional in mammalian target tissue and cells and a sequence acceptance site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; 7-transmembrane receptor; lectomedin; lectin-binding; mucin; olfactomedin; cellular adhesion; atherosclerosis; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                which accepts CDNA products from RT-PCR cloning. The vectors are non-replicating in mammalian cells but are capable of extended stable expression of the target sequence, generating an immune response in immunised individuals. The vectors selectively elicit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             immune responses to the target sequences with little or no immune response to the other components of the vectors. The vectors are particularly useful in accompdating monomorphic and polymorphic nucleic acid sequences encoding tumor antigens via PCR technology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

The invention provides purified and isolated human 7-transmembrane receptor lectomedin polypeptide or its fragments. The lectomedin polypeptide or its fragments. The lectomedin-like and mucin-like domains. The polypeptide can be produced by standard recombinant methodology. The polypeptide is involved in cellular adhesion and cytoplasmic metabolic pathways that are modulated by extracellular signaling. Specific binding to lectomedin. Expressed on smooth muscle cells may be required for proliferation of these cells in atherosclerosis. The polypeptide is used to raise specific antibodies, and to identify specific mining agents that modulate (increase or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            decrease) its activity. The lectomedin nucleic acids are used as source of probes and primers, and of therapeutic antisense, riboxyme or triplex-forming agents, and in gene therapy to restore deficient lectomedin activity. Specific binding agents of lectomedin are are used for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diseases that involve lectomedin activity, e.g. vascular diseases such as atherosclerosis. The present sequence represents a primer for amplifying a human lectomedin-2 clone 2-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antiatherosclerotic; vasotropic; cytostatic; gene therapy; atherosclerosis; restenosis; vascular disease; peripheral neuropathy; cancer; nerve regeneration; renal cystic epithelium; uterine implantation; PCR primer; ss.

The present sequence is a PCR primer which was used in a procedure for isolating human seven transmembrane receptor lectomedin polypeptides. The polypeptides have a characteristic extractular structure including lectin-binding, olfatcomedin-like and mucin-like domains. Modulator compounds that inhibit the binding of lectomedin to a binding partner (galectin-3) may be used to treat conditions such as atherosclerosis, restenosis, vascular disease, peripheral neuropathy, cancer, nerve regeneration, and pathologies of the renal cystic epithalia and uterine implantation. Nucleotide sequences encoding the lectomedin polypeptides or useful in gene therapy. The lectomedin polynucleotides and polypeptides may be used to identify lectomedin binding partner compounds. The polynucleotides are useful for detecting lectomedin cexpression in cells and for identifying genetic mutations in the lectomedin genes. Antisense lectomedin nucleic acids are able to inhibit expression of lectomedin genes.
                                                                                                                                                                                                                                                                                           Isolated human seven transmembrane receptor lectomedin polypeptide or its fragment, useful for identifying agents which can treat atherosclerosis, restenosis or vascular disease .
                                                                                                                                                                                                                 Douangpanya J, Puri KD;

/note="Vector: pBluescript II SK+; Site_I: EcoRI; Site_2:
XhoI; The CDNA library wms constructed from mRNA isolated
from 2.3 week old seedlings that were induced for symptoms
of SDS (Sudden Death Syndrome) disease by the
translocation of culture filtrate of Fusarium solani f.
Sp. glycines (Plant Cell Report 18:375-380). Cultivar PI
567374 is partially resistant to the disease SDS. Plant
tissue (expanded leaves, folded leaves, and new shoots)
were collected at 1, 6, 24, and 48 hrs. after inoculation
and their mRNA pooled equally for cDNA construction. The
library was prepared using the Stratagene pBluescript II
SK(+) library construction kit. Complementary DNA was
synthesized from mRNA using a primer consisting of a

                                                                                                                                                                                    Dp
poly(dT) sequence with an XhoI restriction site. EcoRI adaptors were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA insert is protected from XhoI digestion wis methylation during first strand synthesis. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into E.coli ElectroMax DH10B host cells. Plants were inoculated by Shuxian Li (Glen Hartman lab, University of Illinois). Library was constructed by Steve Clough (Lila Vodkin lab, University of Illinois).

ATPIVX 902 bp DNA SYN 28-SEP-1992 Cloning vector pi-VX used for screening bacteriophage lambda gene libraries for specific DNA sequences in Escherichia coli. Probe sequences are inserted in the vector pi-VX. Contains a polylinker, and origin of replication (derived from pMB1) and a tyrosine amber-suppressor gene (synthetic supF gene).

#TYPE DNA CIRCULAR
TITLE Pi-VX - Cloning vector used for screening bacteriophage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Purification of genomic sequences from bacteriophage libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the sequence of the PiVX origin is from pBR345 as published in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Genetic and Physical Studies on the replication of ColEl-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The ATCC strain 39083 contains PiVX in combination with plasmid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequence given for pBR345 differs at one position from that of pBR322. This may be a sequencing error.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The origin of replication is derived from pMB1 via pBR345 and pKB413. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Backman K., Betlach M., Boyer H.W., Yanofsky S.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

polynucleotide vectors. The vector for novel humanised polynucleotide vectors. The vector in Escherichia coli DH polynucleotide vectors. The vector in Escherichia coli DH luman derived promoter or mammalian homologue which is functional human derived promoter or mammalian homologue which is functional no mammalian target tissue and cells and a sequence acceptance site (see AAV21715-536) which accepts cDNA products from RT-PCR cloning. They also contain minimal non-human components, such as a replication or repeits and selectable marker gene (see AAV2171-18) that are necessary for production of the vector. The novel vectors are used to express target antigens, especially tumour antigens. They are non-replicating in mammalian cells but are capable of extended stable expression of target sequences generating an immune response in immunised individuals. The vectors selectively elicit immune response to the target sequences with little or no immune response to the other components of the vectors. The target antigens are expressed as intracellular polypeptides or peptides and appropriately
                                                                                                                                                               Humanised polynucleotide vectors - comprising human derived promorand sequence acceptance site, used for the production of vaccines

```

polynucleotide vectors. The vector for novel humanised polynucleotide vectors. The vector in Escherichia coli DH colynucleotide vectors. The vector in Escherichia coli DH colynucleotide vectors. The vector somprise a human deralved promoter or mammalian homologue which is functional in mammalian target tissue and cells and a sequence acceptance site (see AAV2173-36) which accepts cDNA products from RT-PCR coloning. They also contain minimal non-human components, such as a replication origin (see AAV21715) and selectable marker gene (see AAV2171-18) that are necessary for production of the vector. The novel vectors are used to express target antigens, especially tumour antigens. They are non-replicating in mammalian cells but are capable of extended stable expression of target sequences generating an immune response to the target sequences with little or no immune response to the target sequences with little or no immune response to the target sequences with little or no immune response to the target sequences with little or no immune response to the target sequences with little or no immune response to the target sequences with little or no immune response to the other components of the vectors. The target antigens are expensesed as intracellular polypeptides or peptides and, as such, are processed as self polypeptides or peptides and appropriately presented on antigen presenting cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        plasmid pITL-1 GFP comprises base vector pITL-1 (see AAV21733) and a humanised green fluorescent protein (GFP) reporter sequence (see AAV21725). Novel humanised vectors comprise a human-derived promoter or mammalian homologue which is functional in mammalian target tissue and cells and a sequence acceptance site which accepts cDNA products from RT-PCR cloning. The novel vectors are used to express target antigens, especially tumour antigens. They are non-replicating in mammalian cells but are capable of extended stable expression of target sequences generating an immune response in immunised individuals. The vectors selectively elicit immune
